CS151 Intro to Data Structures

Doubly LinkedLists

Announcements

- HW01 and Lab02 due Friday
  - Expandable Array
- lab today will be on linked lists

Warm up

```
public int mystery() {
        int sum = 0;
        Node cur = head.next;

        while (cur != null) {
            Node temp = cur.next;
            while (temp != null) {
                if (cur.data < temp.data) {
                    sum += cur.data;
                } else if (cur.data == temp.data) {
                    return -1;
                }
                temp = temp.next;
            }
            cur = cur.next;
        }
        return sum;
}
```

1. At a high level, what does this method do conceptually?

1. What is the return value if the linked list contains $[3 \rightarrow 7 \rightarrow 2 \rightarrow 7]$?

1. What is the return value linked list contains $[5 \rightarrow 4 \rightarrow 3 \rightarrow 2 \rightarrow 1]$?

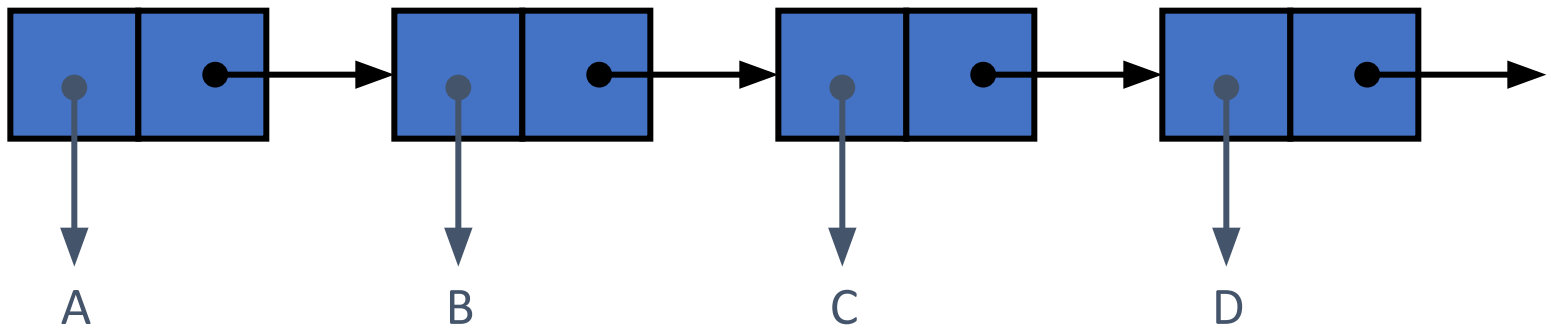
1. What is the time complexity of this method?

Outline

- LinkedLists review
- Fancy LinkedLists (Doubly Linked Lists)

Linked List

- A linked list is a lists of objects (**nodes**)
- The **nodes** form a linear sequence
- Linked lists are typically unbounded, that is, they can grow infinitely.



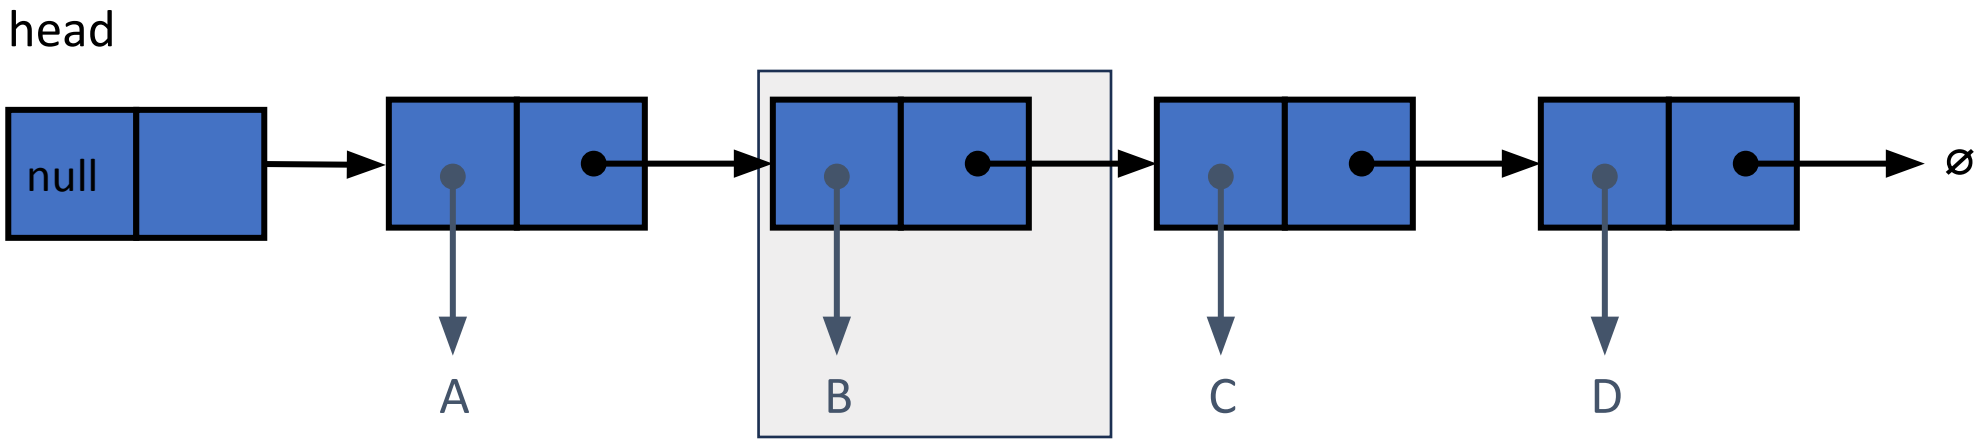
Access Operation

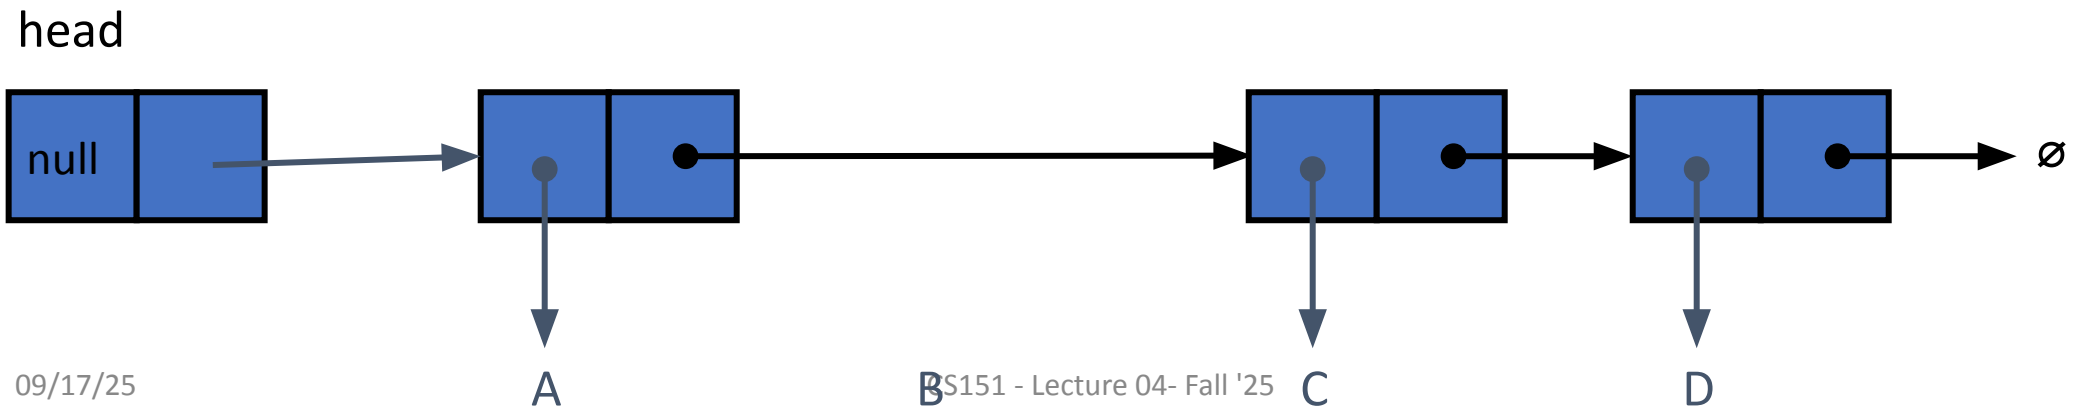
- Computational Complexity?
  - O(n)

Insert Operation

- Computational complexity?
  - Insert at head?
    - O(1)
  - Insert at tail?
    - O(n)
  - Insert at arbitrary location? (middle of list)
    - O(n)

Remove Operation `remove("B")`





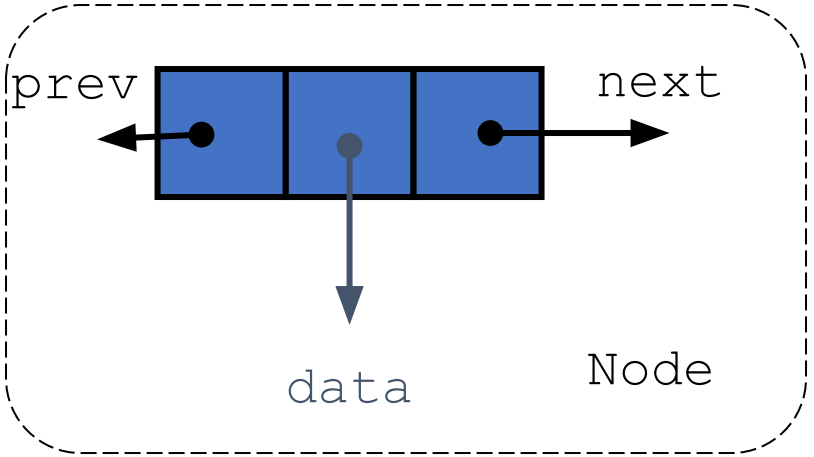
Remove Operation

- Computational complexity?
  - remove head?
    - O(1)
  - remove tail?
    - O(n)
  - remove a particular element?
    - O(n)

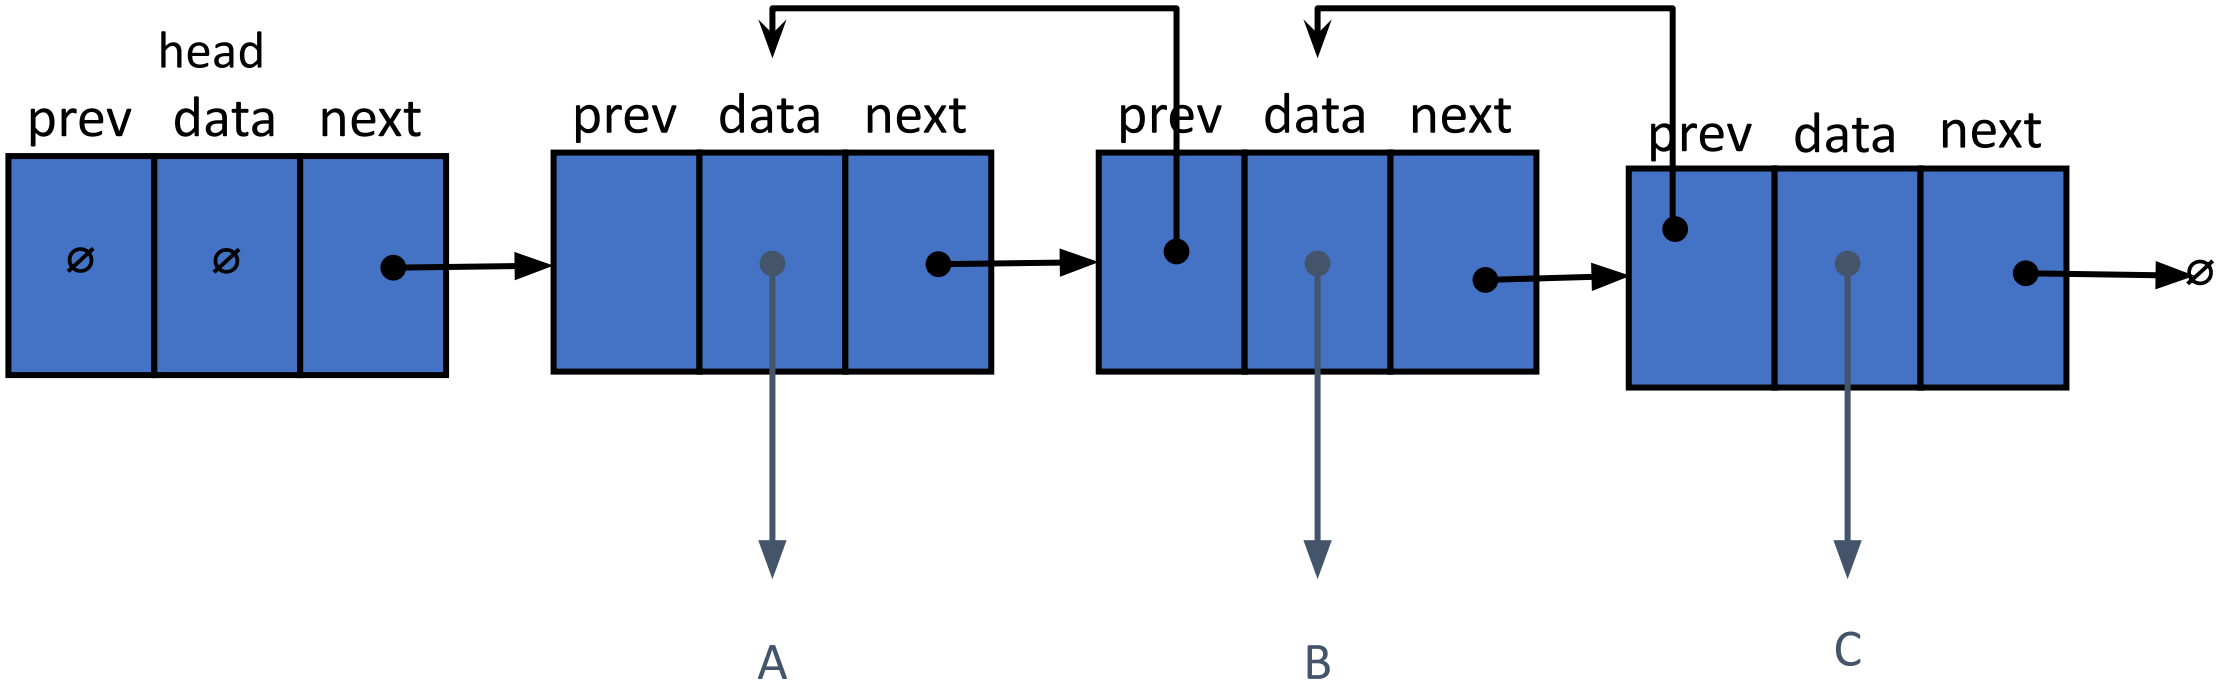
Doubly Linked Lists

A node

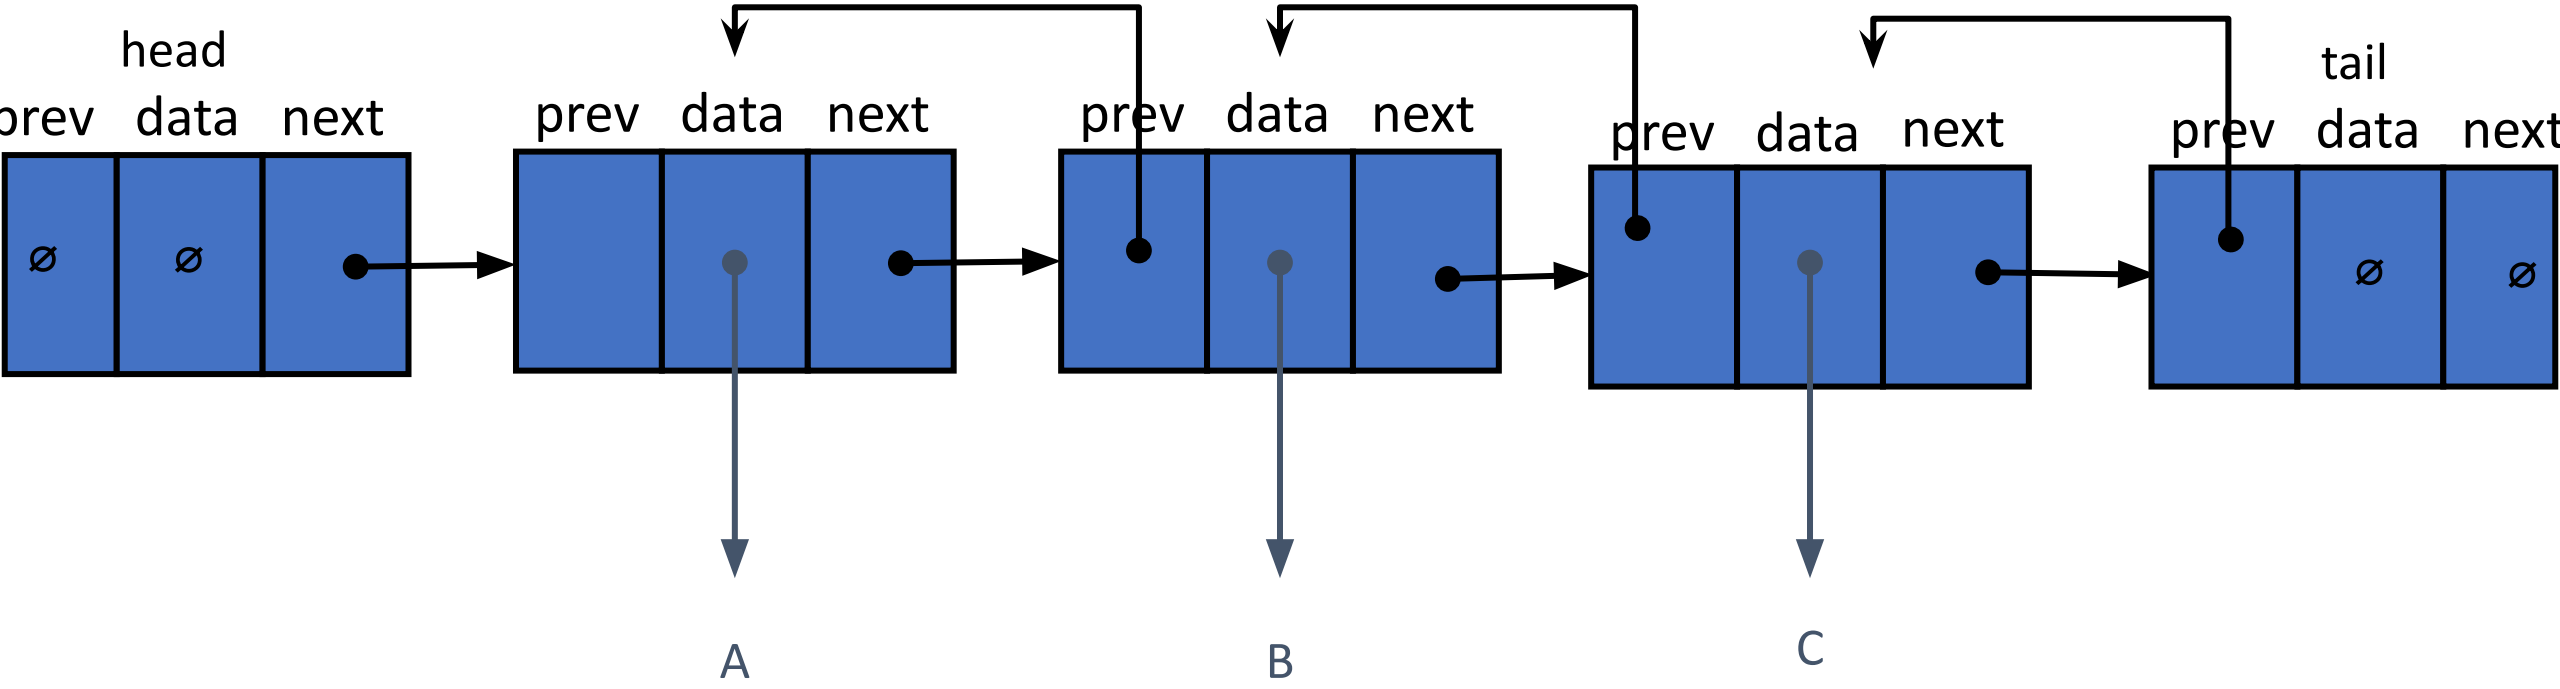
```
public class Node<T> {
   private T data;
   private Node next;
   private Node prev;
}
```



Doubly Linked List



Doubly Linked List



Lab today: Doubly Linked Lists

You'll be implementing a SLL and DLL

`insertSortedAlpha: inserted into the list in alphabetically sorted order`

How would you implement insertSorted with numeric values?

Comparing Strings in Java

`compareTo()` method is used to compare two strings lexicographically.

```
int result = str1.compareTo(str2);
```

It compares two strings character by character based on their Unicode values.
The method returns:

- `0` if `str1` is equal to `str2`
- A **negative value** if `str1` is lexicographically smaller than `str2`
- A **positive value** if `str1` is lexicographically greater than `str2`

ASCII Table

Dec	Hex	Oct	Char	Dec	Hex	Oct	Char	Dec	Hex	Oct	Char	Dec	Hex	Oct	Char

28	1C	34		60	3C	74	<	92	5C	134	\	124	7C	174	|
29	1D	35		61	3D	75	=	93	5D	135	]	125	7D	175	}
30	1E	36		62	3E	76	>	94	5E	136	^	126	7E	176	~
31	1F	37		63	3F	77	?	95	5F	137	_	127	7F	177	

Case Sensitivity

compareTo() is case-sensitive

```
"Apple".compareTo("apple")
```

returns a negative value since 'A' has a lower Unicode value than 'a'.

Summary

- Doubly Linked Lists
  - nodes have a prev field
  - tail dummy node

- get, insert, and remove
  - O(n) operations
  - Need to take special care for .prev fields

- Use more memory than SLLs, but allow for backward traversal
